### Certificate Authority CinemaVision CA

The certification center software, together with HSM devices (Hardware Security Module), create a technical and organizational solution enabling issuing and employment the certificates, used to ensure integrity, confidentiality, identification and non-repudiation access to sensitive data services.

#### The use of certificates is dedicated to founders and film teams:

- ✓ mainly using film material (image and sound) in digital formula
- ✓ assuming participation of a large number of film specialists and producers of various creation fields in the production process (also coming from co-production and subcontracting entities)
- ✓ demanding a confidential project repository at every stage of film production
- ✓ applying various technical solutions in the field of archiving, exchanging and sharing files with film materials
- ✓ applying agile methods of film production, assuming simultaneous production with pre-production and post-production
- ✓ being aware of the risks data confidentiality breaches during storage and processing of digital repository
- ✓ requiring secure archiving procedures and controlled permanent sharing of large numbers of files within film team specialists property different access rights.

#### CinemaVision CA certification covers:

- ✓ experts:
  - included in the basic and extended film crew
  - cooperating remotely with each other
  - performing various technical activities on behalf of cooperating co-producers, subcontractors and distributors
- ✓ hardware infrastructure:
  - devices for registration and projection
  - network, servers and local workstations

#### Certificate Authority ensures:

- ✓ indisputable authentication of people and devices
- ✓ obtaining practical security in the field of archiving and sharing film materials in accordance with the assumed competences of individual specialists within the film team
- ✓ high comfort of use in relation to the costs of ongoing service, taking into account the speed and efficiency of issuing / exchanging certificates and no requirement of an expert with high domain skills to participate in this process
- ✓ long period of utilization without incurring further costs, due to the practically unlimited number of issued certificates in the system.

### Certificate Authority CinemaVision CA

Certification under CinemaVision CA guarantees indisputable authentication of people and devices and creates conditions for the implementation of intelligent and controlled access to data.

#### CinemaVision CA certification center meets high requirements:

- ✓ full integration with the hardware security module HSM (security certificate according to FIPS-140-2 standard at levels 2 and 3)
- ✓ the possibility of implementation in the test instance without the use of HSM and in the production instance with the use of HSM
- ✓ support for all modern and safe algorithms recommended by eIDAS (SHA-256 / SHA-512 hash functions and RSA keys with a length of 2048/4096/8192 bits)
- ✓ automatic support for the repository of certificates, CRL lists, OCSP services and TSA time stamping
- ✓ possibility of working in increased security mode (off-line mode)
- ✓ working with clusters of HSM devices to achieve high availability (HA) and scaling performance
- ✓ a license that allows utilization by an unlimited number of users, systems, certificates and certification authorities
- ✓ a license that allows the support of all encryption key lengths supported by HSM
- ✓ full respect of the planning, installation, commissioning and operation procedures required for the certification center.

#### The provision of CinemaVision CA services is based on:

- ✓ documentation compliant with RFC 3647 recommendations, including:
  - Certification Policy (CP)
  - Certification Practice Statement (CPS)
  - internal procedures (CV.CA.PROC)
  - instruction for subscribers (INS)
- ✓ object identification (OID).

#### Types of certificates under CinemaVision CA:

- ✓ **OCSP** — used internally by the online service, to sign responses to requests for certificate status
- ✓ **Personal** — for signing and encrypting data sent electronically, mainly by e-mail, for system access authorization and customer authentication in SSL connections
- ✓ **Code signing** — for confirming the identity of network routers. It allows you to create virtual private networks by setting up encrypted connections
- ✓ **IPsec** — for confirming the identity of routers in both local and internet networks. It allows you to create virtual private networks by setting up encrypted connections
- ✓ **SSL** — for securing web servers and confirming their authenticity. It allows you to set up an encrypted SSL connection between certificate servers and clients and to provide secure login to services.
